VISION & SOVEREIGNTY CHARTER

Ecosystem

HMOS® · HYBRID MASTER OPERATING SYSTEM

Six principles. Three of them first. And the three that hold them together.

Systems for Sovereignty, Made for Certainty.

PAGES	SECTION	STATUS
Charter 07 – 08	03 · Principles	Draft v0.3

Six principles. Three of them first.

01 Certainty over cleverness

Deterministic outcomes beat impressive demos.

When a clever approach and a predictable one compete, the predictable one ships. Behaviour is specified in advance, and anything the system cannot explain is treated as a defect, not a feature.

EVIDENCE Repeat runs of the same input, with the results compared.

02 Sovereignty by default

The customer controls their data, code and keys.

Control is the starting position, never an add-on. Nothing leaves the customer's boundary unless the customer has chosen it, and every dependency is one the customer could inspect or replace.

EVIDENCE A written inventory of what crosses the boundary, and why.

03 Zero trust, no exceptions

Nothing is trusted because of where it runs.

Every user, service and AI agent proves itself for each action. Access is the minimum needed, for the shortest time needed. Being inside the network earns nothing.

EVIDENCE Access decisions that are logged and can be replayed.

And the three that hold them together.

04 Consensus before action

No single component makes a critical decision alone.

Actions that change critical state need independent agreement first: more than one checker, more than one view. A model's suggestion is an input to a decision, never the decision.

EVIDENCE Records showing who or what agreed, and on what basis.

05 Less code, same behaviour

Reduce surface area without changing what the system does.

Smaller systems have fewer places to fail and fewer places to hide. Any simplification must prove that behaviour is unchanged before it is accepted.

EVIDENCE A before-and-after behaviour comparison on the same inputs.

06 Discipline as architecture

Quality is a pipeline, not a mood.

Checks are built into how work moves, so quality does not depend on anyone's energy that day. A check that can be skipped will eventually be skipped, so the pipeline does not offer that option.

EVIDENCE A pipeline that fails visibly, and says why.
